

Report

This project aims to create a Gym Membership Management Database System through the use of SQL and Java programming languages to effectively manage data regarding gym members, trainers, membership schemes, and training sessions. The database system was well designed through the use of multiple tables with primary and foreign keys to ensure the integrity of the data as well as the relationships between the data. Various SQL operations such as INSERT, SELECT, UPDATE, and DELETE were also used to ensure full control over the database system, hence effective database management. Furthermore, Java programming was also incorporated in the project to ensure the database system is interactive through the use of JDBC to connect to the MySQL database system, hence the effectiveness of the database system. Therefore, the project aims to demonstrate the real-life application of database design, SQL programming, and Java programming.
